

# BeagleBone Black – Maker tested, engineer approved

## BeagleBone Black

Open-source Linux computer

Everything you need to get started for ~\$50

For hobbyists, engineers and students

**Jason Kridner**  
**Co-Founder**  
**BeagleBoard.org**

# MUG Agenda

- What is open hardware? Why did BeagleBoard.org choose to make BeagleBone Black open hardware? What does this mean to professionals? What does it mean to novices? Jason Kridner, co-founder of BeagleBoard.org, will explore the experiences of makers like David Lang, author of "Zero to Maker", who went from unemployed to running OpenROV, a community and business building open hardware underwater exploration vehicles. Learn about working with local communities and manufacturers to dive into the fun world of connected electronics.
- Jason Kridner is the co-founder of BeagleBoard.org, where he has helped create open source development tools such as BeagleBone Black, BeagleBone, BeagleBoard, and BeagleBoard-xM. Kridner is also a software architecture manager for embedded processors at Texas Instruments (TI).

# My History

<http://newcome.wordpress.com/2009/12/15/make-electronics-the-new-engineers-notebook/>  
[http://www.sandywalsh.com/2012\\_07\\_01\\_archive.html](http://www.sandywalsh.com/2012_07_01_archive.html)

# My History

- Over 20 years at Texas Instruments
  - Building and testing boards, chips and software
  - Training people to do my old jobs
- Watching people get frustrated with technology
  - Expectations have changed
- Saw opportunity to share latest mobile technology

# Vision for BeagleBoard.org

- Creating with electronics should be as easy as creating a web page

# Vision for BeagleBoard.org

- Creating with electronics should be as easy as creating a web page
- Appliances are better than applications

# Vision for BeagleBoard.org

- Creating with electronics should be as easy as creating a web page
- Appliances are better than applications
- Open source software and hardware enable
  - Collaboration on the problem
  - Ability to understand and improve the fundamentals

# BeagleBone Black – an evolution

	BeagleBoard	BeagleBoard-xM	BeagleBone	BeagleBone Black
Board				
Quick summary	The original open hardware, ARM-based development board	All features of the original BeagleBoard with extra memory and extra performance	Low-cost, open-source community platform with plug-in board expansion	Next-generation BeagleBone featuring 1-GHz processor
Memory	256KB L2 cache	512MB DDR2	256MB DDR2	512MB DDR3
Special features	2D/3D graphics accelerator, HDMI, HD video capable, USB powered, C6000 DSP	1-GHz processing power, HDMI, HD video capable, Four- port hub with Ethernet, C6000 DSP	USB-powered, Ethernet, USB JTAG, PRUs	eMMC, HDMI, USB-powered, Ethernet and HDMI interfaces, PRUs
Price (\$U.S.)	\$129	\$149	\$89	\$45-\$55

# BeagleBone Black

## 1 GHz performance, ready to use

Truly flexible open hardware and software development platform

All you need is in the box

Proven ecosystem from prototype to product

### BeagleBone Black

- Ready to use: ~\$50
- 1 GHz performance and embedded microcontrollers
- On-board HDMI to connect directly to TVs and monitors
- 512MB DDR3-800 RAM
- On-board 4GB flash storage with Debian frees up the microSD card slot
- Support for existing Cape plug-in boards:  
<http://beaglebonecapex.com>

**Most affordable and proven open hardware Linux platform available**

# BeagleBone Black board features

## 10/100 Ethernet

## USB Host

Easily connects to almost any everyday device such as mouse or keyboard

## microHDMI

Connect directly to monitors and TVs

## microSD

Expansion slot for additional storage

## 512MB DDR3

Faster, lower power RAM for enhanced user-friendly experience

## Serial Debug

## DC Power

## Expansion headers

Enable cape hardware and include:

- 65 digital I/O
- 7 analog
- 4 serial
- 2 SPI
- 2 I2C
- 8 PWMs
- 4 timers
- And much much more!

## Boot Button

## Power Button

## LEDs

## Reset Button

## USB Client

Development interface and directly powers board from PC

## 4GB on-board storage using eMMC

- Pre-loaded with Debian Linux Distribution
- 8-bit bus accelerates performance
- Frees the microSD slot to be used for additional storage for a less expensive solution than SD cards

## 1 GHz Sitara AM335x ARM® Cortex™-A8 processor

Provides a more advanced user interface and up to 150% better performance than ARM11

## Money saving extras:

- Power over USB
- Included USB cable

- 4GB on-board storage
- Built-in PRU microcontrollers

# BeagleBone used in many applications

- Medical
- Citizen Science
- Home Automation
- Network Security
- Localizing Information
- Assistive Technology
- LEGO Robotics
- Simple Mobile Robots
- Industrial Robots

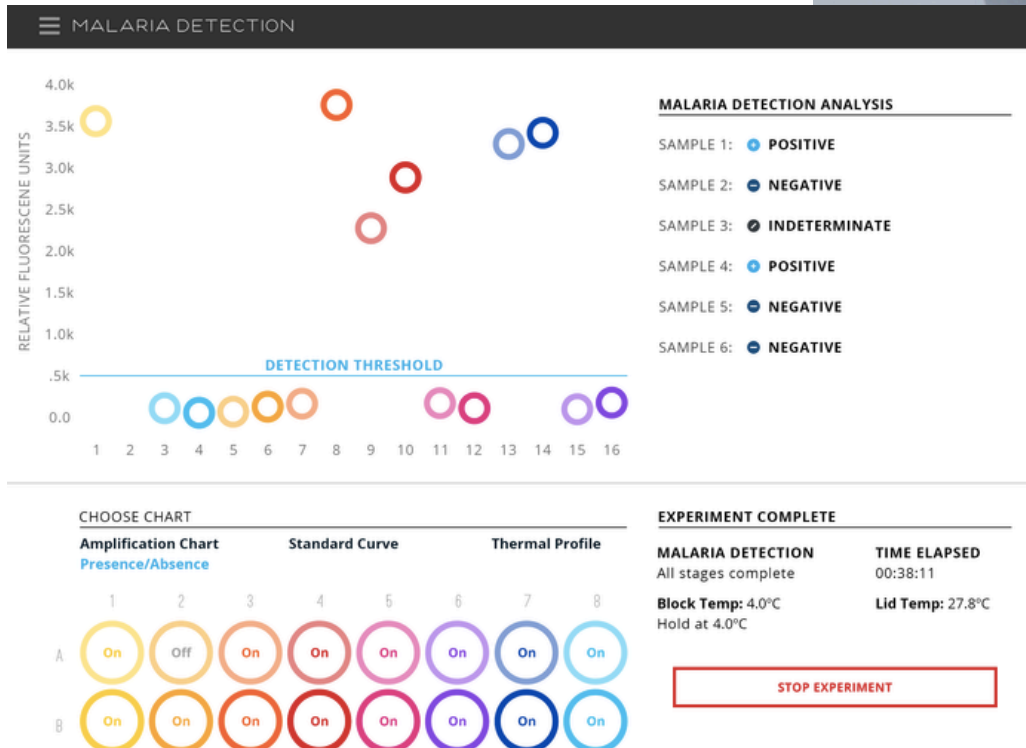

# 10,000s of developers building connected devices today

- Medical analysis, assistance and information management
- Home information, automation and security systems
- Home and mobile entertainment and educational systems
- New types of communications systems
- Personal robotic devices for cleaning, upkeep and manufacturing
- Remote presence and monitoring
- Automotive information management and control systems
- Personal environmental exploration and monitoring

# Open qPCR

DNA Diagnostics for  
Everyone

# OpenROV

Open source underwater robots for exploration and education

# The Deck

Full-featured penetration and forensics testing Linux distribution

# Freedombone

Serve your cloud from your home

# EVB

Replace the brain of your LEGO EV3 with BeagleBone Black

# Coursera + O-botics.org

# Massively open online course on control of mobile robots

A place where roboticists can collaborate on robot designs, code, electronics, and hardware

# Lasersaur

Open-source laser cutter for makers and builders

**Let's try it out**

# BoneScript: Arduino-like simplicity + the power of a 1GHz Linux computer

## Browser-based interactive teaching environment

- Zero-install
- Runs directly on BeagleBone Black
- Hides Linux complexity

## Power of 1GHz computer on demand

- Networking and USB stacks
- Open-source frameworks available
- Accessible keyboard/mouse/monitor
- Accessible over SSH from PC

## BoneScript

- Arduino-like software for easy module interactions

192.168.7.2/digitalWrite.html

beagleboard.org

Bonescript

BeagleBone 101

Software

- Update image
- Cloud9 IDE
- GateOne SSH

Hardware

- Headers
- Capes

Bonescript Functions

- getPlatform()
- pinMode()
- getPinMode()
- digitalWrite()
- digitalRead()
- shiftOut()
- analogWrite()

Capes

Bacon Cape

**Your board is connected!**  
BeagleBone Black S/N 0113BBBK0100 at 192.168.7.2

You might be able to see a newer version of this on [beagleboard.org/support/bonescript/digitalWrite](http://beagleboard.org/support/bonescript/digitalWrite)

**digitalWrite(pin, value, [callback])**

Write a **HIGH** or **LOW** to a digital I/O pin.

NOTE: The 4 USRx LEDs are all able to operate as digital output pins, giving you an always-available output to test your software.

Arguments

- *pin*: the BeagleBone pin identifier
- *value*: the logic level to set the pin
- *callback*: called upon completion

Return value

- true if successful
- false on failure

callback(x)

- *x.err*: error status message

Example

```
1 var b = require('bonescript');
2 b.pinMode('USR0', b.OUTPUT);
3 b.digitalWrite('USR0', b.HIGH);
```

Bonescript: initialized

Build and execute instructions

- The USR0 LED is built in, so no circuit assembly is

## Talks directly to the board

- Programmatic interface into the board

## Built on familiar programming environments

- JavaScript
- HTML5
- Node.js

## Examples run directly in browser

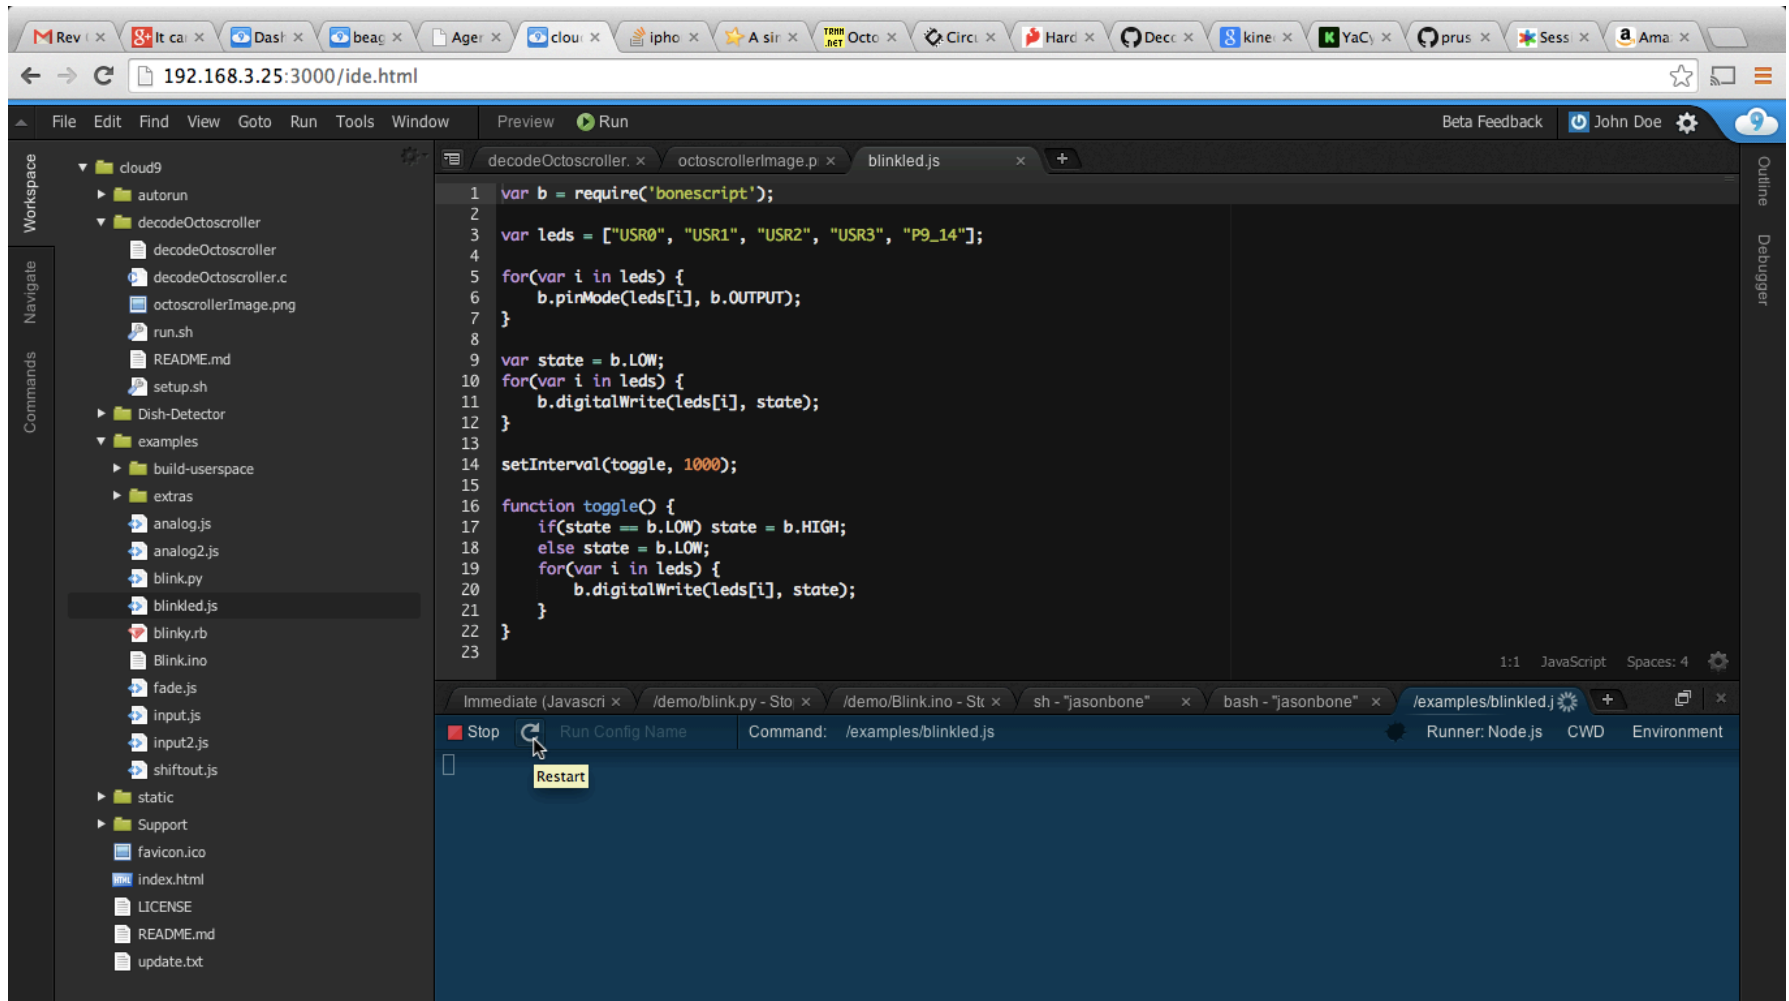

- Click to run
- Editable in browser
- Experiment to learn
- Copy and paste

# BoneScript in the browser

# Cloud9 IDE included

# Our challenges and solutions in this lab

- Typical out-of-box is to use USB networking and on-board provided drivers, but we wanted to get out to the Internet quickly
- We know we can connect to “MIT GUEST” WiFi, so we started with an image with all the tools we needed to get on the network
- Typical network supports mDNS on LAN for discovery using “beaglebone.local”, but didn’t prove reliable on our network
- Each board has a unique serial number that is printed on a label on the board and readable using an EEPROM on the board
- Dweet.io is a nice tool to publish data with a simple network operation
- We chose to use Dart, because it’s Brian’s language of choice, to perform the data fetch and publish:  
<https://gist.github.com/jadonk/178f9aa0f96363e4277e>
- Flash duplicated using `/opt/tools/scripts/eMMC/beaglebone-black-make-microSD-flasher-from-eMMC.sh`

# Our setup – how to get connected

- Chose to publish using name “beagle-at-mit”
  - <http://bit.ly/beagleatmit>
  - Search for your serial number in the log and match the ip
- Option #1 - ssh
  - ssh root@10.189.37.24
- Option #2 - Chrome
  - <http://10.189.37.24:3000>

# Some quick interfaces to hack

- LEDs

```
root@beaglebone:~# cd /sys/class/leds/beaglebone\:green\:usr0
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# cat trigger
```

```
none nand-disk mmc0 mmc1 timer oneshot [heartbeat] backlight gpio cpu0 default-on transient
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# echo none > trigger
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# echo 1 > brightness
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# echo 0 > brightness
```

- GPIOs

```
root@beaglebone:~# node -pe "require('bonescript').bone.pins.P9_14.gpio"
```

```
50
```

```
root@beaglebone:~# node -pe "require('bonescript').bone.pins.P9_14.muxRegOffset"
```

```
0x048
```

```
root@beaglebone:~# cat /sys/kernel/debug/pinctrl/44e10800.pinmux/pins | grep 0848
```

```
pin 18 (44e10848) 00000027 pinctrl-single
```

```
root@beaglebone:~# node -pe "require('bonescript').getPinMode('P9_14').pullup"
```

```
pulldown
```

```
root@beaglebone:~# cd /sys/class/gpio
```

```
root@beaglebone:/sys/class/gpio# cat gpio50/direction
```

```
in
```

```
root@beaglebone:/sys/class/gpio# cat gpio50/value
```

```
0
```

# Some quick interfaces to hack

- LEDs

```
root@beaglebone:~# cd /sys/class/leds/beaglebone\:green\:usr0
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# cat trigger
```

```
none nand-disk mmc0 mmc1 timer oneshot [heartbeat] backlight gpio cpu0 default-on transient
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# echo none > trigger
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# echo 1 > brightness
```

```
root@beaglebone:/sys/class/leds/beaglebone:green:usr0# echo 0 > brightness
```

- GPIOs

```
root@beaglebone:~# config-pin overlay cape-universaln
```

```
Loading cape-universaln overlay
```

```
root@beaglebone:~# config-pin p9.14 gpio_pd
```

```
root@beaglebone:~# config-pin -q p9.14
```

```
P9_14 Mode: gpio_pd Direction: in Value: 0
```

```
root@beaglebone:~# cd /sys/class/gpio
```

```
root@beaglebone:/sys/class/gpio# cat gpio50/direction
```

```
in
```

```
root@beaglebone:/sys/class/gpio# cat gpio50/value
```

```
0
```

# Hacking with the ADC

- Don't forget it is only **1.8V** --- use that voltage divider stuff David was showing you or you'll **damage your board!!!**
- The overlay will load an ADC driver

- Steps

```
root@beaglebone:~# config-pin overlay BB-ADC
```

Loading BB-ADC overlay

```
root@beaglebone:~# config-pin -q p9.36
```

Pin is not modifyable: P9\_36 AIN5

```
root@beaglebone:~# cd /sys/bus/iio/devices/iio\:device0
```

```
root@beaglebone:/sys/bus/iio/devices/iio\:device0# cat in_voltage5_raw
```

1850

# BeagleBone Black vs. Raspberry PI

- Made from an industrial control processor
- Out-of-box experience (as you've seen)
- Capes
- Programmable Real-time Units (PRUs)
- Open hardware
- (there are more, but we'll discuss these first)

# BeagleBone Capes

<http://beaglebonecapes.com>

- Just another word for a daughterboard
- Many have a cape-like formfactor
- Up to 4 stacked, depending on resources used
- Most are open hardware

# Capes easily expand BeagleBone capability

**Breadboard**

**Breakout**

**LCD**  
7", 4.3" or 3.5"

**DVI-D**

**CANBus**

**RS232**

# True open-source hardware and software

## Development Unchained

**You can get the chips, the docs and the software!**

Open source gives people the freedom to control their technology while sharing knowledge and encouraging commerce through the open exchange of designs and code

# Open Source Hardware Principles

- Design publicly available for study, modification, distribution, making, and selling the design or hardware based on that design
- Source available in format for making modifications to it
- Ideally, open source hardware uses readily-available components and materials, standard processes, open infrastructure, unrestricted content, and open-source design tools to maximize the ability of individuals to make and use hardware
- Open source hardware gives people the freedom to control their technology while sharing knowledge and encouraging commerce through the open exchange of designs

<http://www.oshwa.org/>

# Lessons from open source software

- Discover and address security and other flaws
- Alter to suit user wishes
- Use as basis for a new product

<http://arstechnica.com/information-technology/2013/10/arduino-creator-explains-why-open-source-matters-in-hardware-too/>

# Mapping this to hardware

- "Because open hardware platforms become the platform where people start to develop their own products," Banzi told Ars.
- "For us, it's important that people can prototype on the BeagleBone [a similar product] or the Arduino, and if they decide to make a product out of it, they can go and buy the processors and use our design as a starting point and make their own product out of it."

<http://arstechnica.com/information-technology/2013/10/arduino-creator-explains-why-open-source-matters-in-hardware-too/>

# BeagleBone Black Terms and Conditions

- Use design materials as you see fit, just don't blame
- No viral requirements unless you republish the materials
  - Materials licensed as CC-BY-SA
- Materials don't include the BeagleBoard.org logo, for which we expect a license
- Use of boards with BeagleBoard.org logo in commercial projects is discouraged
  - No enforcement, just a request
  - Interferes with planning parts and meeting individual user demand
  - Design may be adjusted to better suite community needs

[http://elinux.org/Beagleboard:BeagleBoneBlack#Terms\\_of\\_Use](http://elinux.org/Beagleboard:BeagleBoneBlack#Terms_of_Use)

# OSHWA checklist

- Comply with definition
- Allow study, modify, distribute, make and sell
- CC documentation w/o NC or ND
- OSHWA logo
- Own logos and trademarks
- Source file format
- Source files online
- Source files findable
- Able to copy
- Free
- Images in documentation
- Emotionally prepared
- Documentation of limits of openness

# Importance to the hobbyist

- Longevity
- More detailed understanding
- Apply learning across more diverse platforms

# Ninja Sphere

Next generation control of your environment

# FastBotBBP

Next generation 3D printer controller

# PROGRAMMABLE REAL-TIME UNITS

# PRU: Programmable Real-time Unit

## Architecture

- Two 32-bit RISC cores for real-time functions each running at 200MHz
- 8KB IRAM, 8KB DRAM, 12KB Shared RAM
- **Single-cycle execution**
- **Direct I/O interface sampling at ~5ns**
- Logic, Control and arithmetic instructions
- 32-bit MULT and Interrupt controller
- Efficient bit/byte/word manipulations

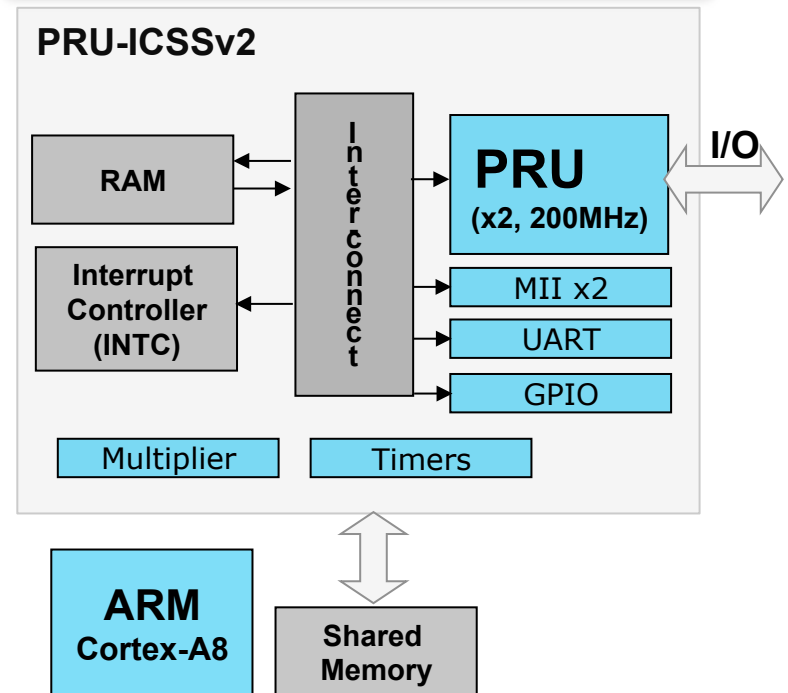

## Capabilities

- Implement **Real-time communication interfaces** : PROFIBUS, EtherCAT, PROFINET & Ethernet/IP
- Implement **custom IP** (such as EnDAT 2.2, SINC3 decimation, PWMs, DP Memory, Manchester Coding, 9 bit UART or a Backplane bus)

## Advantages

- Completely programmable & Flexible
- Reduce system cost & complexity

## AM335x SoC: ARM + PRU

# Community support of PRU

- GCC compiler - <https://github.com/dinuxbg/gnupru>
- Updates to assembler/examples - [https://github.com/beagleboard/am335x\\_pru\\_package](https://github.com/beagleboard/am335x_pru_package)
- Lots of examples - [http://processors.wiki.ti.com/index.php/PRU\\_Projects](http://processors.wiki.ti.com/index.php/PRU_Projects)
  - PRU Speak interpreter - <https://github.com/jadonk/pruspeak>
  - 100MHz 14-channel logic analyzer - <http://beaglelogic.net>
- Driving cottage industries
  - LED lighting, machinekit (3D printing, CNC, ...), ...

# LEDscape and Octoscroller

- Works with Adafruit 32x16 LED panels
- 12-bit color supported through PRU-based pulse-width modulation
- Open source software and hardware
- Content delivered using network packets (Python)
- Supports 64 panels each

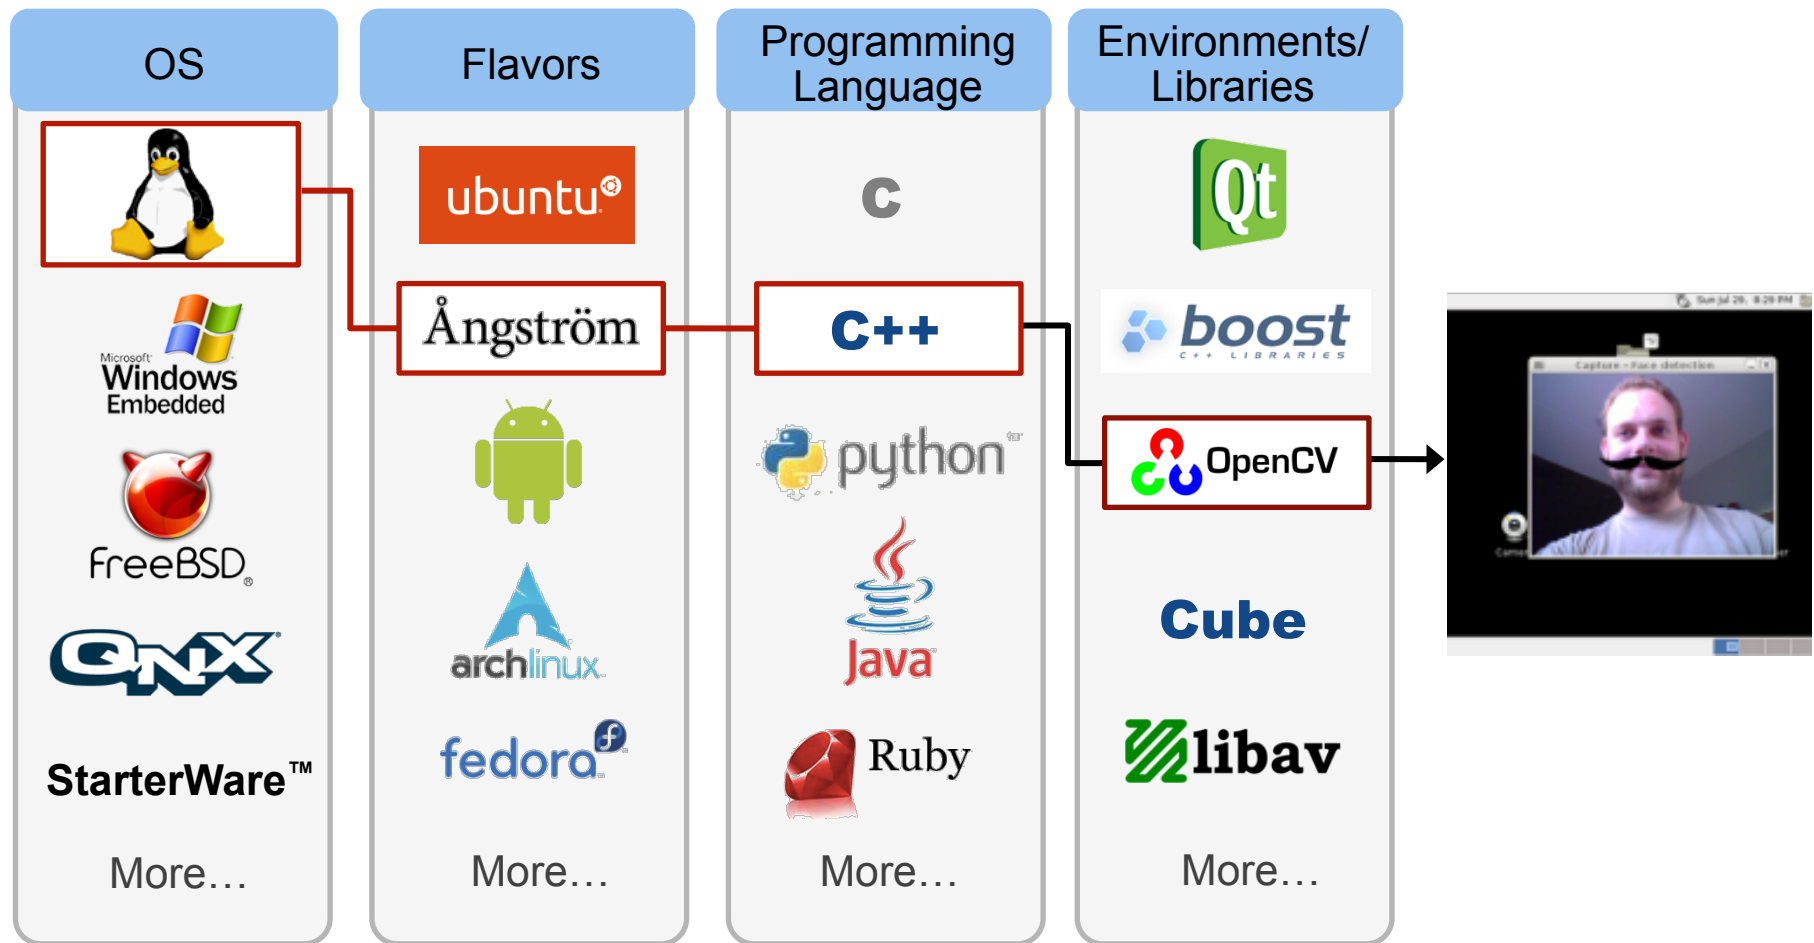

# The community software experience

**Reaching a new class of developer**

# Endless software opportunities

Open industry development platform enabling  
a full range of software

# Node-RED by IBM

The screenshot displays the Node-RED web interface in a browser. The browser's address bar shows the URL `bonetest.mybluemix.net/red/#`. The interface is divided into several sections:

- Left Sidebar:** Contains two panels, 'inputs' and 'outputs', each with a dropdown arrow. The 'inputs' panel lists nodes like 'inject', 'mqtt', 'http', 'websocket', 'udp', 'tcp', and 'iot'. The 'outputs' panel lists nodes like 'debug', 'mqtt', 'http response', 'websocket', 'udp', and 'tcp'. A search bar labeled 'filter' is at the bottom.
- Main Workspace (Sheet 1):** A large area for building flows. It shows a flow with two nodes: a 'Status' node (orange) and a 'Blink' node (purple). The 'Status' node is connected to a 'debug' node (green), and the 'Blink' node is connected to a 'rate' node (blue).
- Right Sidebar:** Contains a 'debug' tab showing a log of messages. The messages are JSON objects, including timestamps and payloads. For example, one message is: 

```
{ "topic": "iot-2/type/iot-sample-ti-bbst/id/9059af69c042/evt/sample/fmt/json", "payload": { "d": { "myName": "TI BLE Sensor Tag bc:6a:29:0:0:ac:ac:7d", "objectTemp": 19.9, "ambientTemp": 19.9, "qos": 0, "retain": false } } }
```

# Supported by many frameworks

# IoT software/network platform providers

- Weaved
- PubNub
- Dweet.io (Bug Labs)
- AllJoyn (alliance)
- Many, many more coming – starting passing these on to Nick Lethaby

# Snappy Ubuntu Core

## What do we need to have Apps Everywhere?

Apps need to run securely, be easily remotely upgradeable & run on a small OS.

### SECURE

Malicious code can not affect other apps or the OS. Secret services should not have backdoors.

### EFFICIENT

The OS needs to be small to fit in many devices. The OS should be extendible to support for all type of extensions.

### EASY

Creating, upgrading and rollback of apps should be easy. Programmers package their software and users get it minutes later.

# Junk slides

# Extended Linux ecosystem for BeagleBone Black

Global community of respected, well-established companies providing products and services for Sitara™ processors that can be used on BeagleBone Black

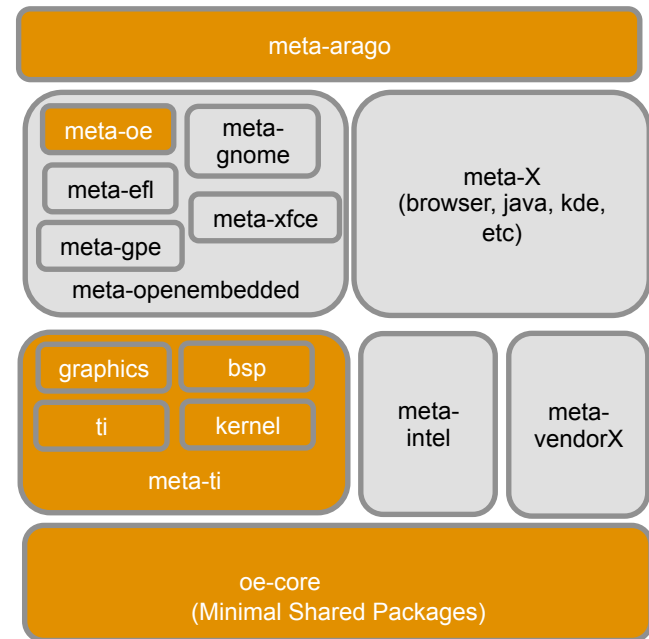

- Turnkey products and services
- System modules
- Embedded software
- Development tools
- Engineering services

Select partners delivered added efficiencies through the Open Embedded-Core-based build system:

- Leverage the well defined foundational layers of Yocto
- Access OE-Core file system
- Effectively tailor software distributions to the requirements of a particular application

## OE-Core/Yocto

# How do you get it

[beagleboard.org/buy](http://beagleboard.org/buy)

# 1GHz performance, lots of peripherals, Ubuntu, Linux and Android, oh my!

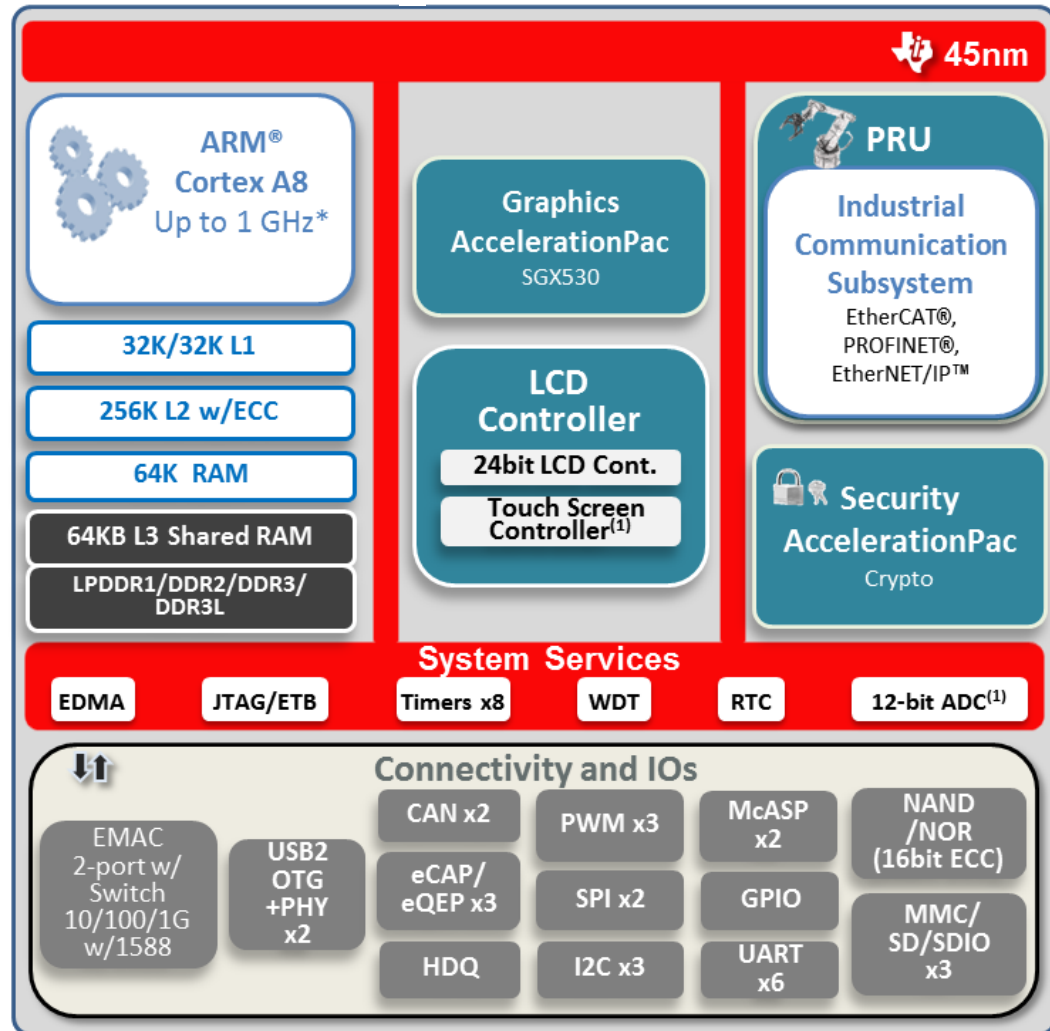

1GHz performance enables:

ARMv7  
instruction set

2.0 DMIPS/MHz

# Innovating just got easier

Engineers

- Access to free documentation and free code examples

- Ability to collaborate on new ideas through open blogs, wikis and web sites

- Access to production ready hardware
- Mainline kernel support for Ubuntu, Android, Fedora and others
- Allows experienced users to get prototype and get to market faster
